

LAB EXPERIMENT RECORD**08-10-2026---Set 14: Survey Results Analysis**

Department	AIML
Course Code / Course Name	DSA0601 / Data Handling and Visualization
Experiment	Data Visualization using R and Tableau
Name	BANDLAPALLI BHANUTEJA REDDY
Register Number	192325016
Date	08 OCTOBER 2026
Day	Thursday

Aim

To analyze survey results using a stacked bar chart, radar chart and table, and to build an interactive Tableau dashboard for exploring the survey responses.

Dataset: Survey Results

Respondent	Question 1	Question 2	Question 3
1	A	B	C
2	B	A	D
3	C	A	B

Question 1: Stacked Bar Chart of Question 1 Answers

Question: Create a stacked bar chart to display the distribution of answers for Question 1. Label the chart elements.

Aim: To display how the respondents answered Question 1 using a labelled stacked bar chart.

Result: Answers A, B and C were each chosen by 1 respondent (33.3% each) and D by none, so the answers are evenly split.

Question 2: Radar Chart of Overall Response Pattern

Question: Generate a radar chart to visualize the overall pattern of responses across all three questions.

Aim: To visualize how often each answer was chosen across Questions 1, 2 and 3 using a radar chart.

Result: Answer B is the most even (chosen once in every question), A peaks on Question 2 (2 respondents), and D appears only on Question 3.

Question 3: Table of Survey Responses

Question: Build a table to show the survey response data for each respondent. Label the table elements.

Aim: To present the answers given by each respondent in a clearly labelled table.

The screenshot shows an RStudio window with several tabs open: 'Table.R', 'SET-13-Scatter Plot - Temperature vs P...', 'SET-14-Stacked Bar Chart.R', 'SET-14-Radar Chart.R', and 'SET-14-SURVEY'. The 'SET-14-SURVEY' tab is active, displaying the following R code:

```

1 #BANDLAPALLI BHANUTEJA REDDY
2 respondent <- c(1,2,3)
3 q1 <- c("A","B","C")
4 q2 <- c("B","A","A")
5 q3 <- c("C","D","B")
6
7 data <- data.frame(respondent, q1, q2, q3)
8
9 print(data)

```

The console output shows the execution of the code, including a loop for plotting and the final data frame printout:

```

> for(i in 1:3) {
+   values <- c(responses[i,], responses[i,1])
+   lines(angles, values, type="o")
+ }
> #BANDLAPALLI BHANUTEJA REDDY
> respondent <- c(1,2,3)
> q1 <- c("A","B","C")
> q2 <- c("B","A","A")
> q3 <- c("C","D","B")
>
> data <- data.frame(respondent, q1, q2, q3)
>
> print(data)
  respondent q1 q2 q3
1           1  A  B  C
2           2  B  A  D
3           3  C  A  B

```

Result: The table lists the three answers of each respondent; Respondent 1 answered A, B, C, Respondent 2 answered B, A, D and Respondent 3 answered C, A, B.

Question 4: Interactive Tableau Dashboard

Question: Develop a Tableau dashboard combining the stacked bar chart, radar chart, and the table for interactive exploration of survey responses.

Aim: To build an interactive Tableau dashboard that combines the stacked bar chart, radar chart and table for exploring survey responses.

Result: The dashboard places all three views together, and a respondent filter updates them so users can explore the responses interactively.

Overall Result

Observation: Out of 9 answers in total, A and B were each chosen 3 times (33.3%), C twice (22.2%) and D once (11.1%).
